**Subject Code: B1201/R10 (2012-2013 Batch)**

(b) Read the passage and answer the questions:

Scientists observe that as the creatures of primeval seas died, their bodies sank into the mud and silt of the ocean floor. Here the sea currents covered them with still more mud and silt. As time passed, the pressure of the water and upper layers of silt slowly hardened the sediments into rock. They do not, however say, how exactly the pressure of the water and the upper layers of the silt slowly hardened the remains of the creatures into rock. They merely state that the bodies of the dead creatures decayed and disappeared but the outline of their forms was preserved forever in the rock.

Scientists assure us that pressures from the inside of the earth slowly bent the rock in places lifted out of the water. What was once the sea-bottom often became dry land? By looking at these uplifted rocks, scientists can tell us that fossils of the ancient animals came to be preserved, in what they call the 'picture book of rocks'.

We now understand how layers of the fossil- bearing rocks have been piled upon one another for millions of years. Scientists have proved why the oldest layers are to be found at the bottom and newer ones at the top. They have also shown that they can place the fossils in their proper time by observing the sequence of the rocks. This gives them a clear and accurate history of sea-life, going back hundreds of million years.

Questions:

- (i) What happened to the bodies of the sea animals when they died?
- (ii) How do scientists prove that certain types of creatures existed in the sea millions of years ago?
- (iii) What are fossils?
- (iv) How are fossils formed?
- (v) What did the scientists say about the dry- land?

[10+5]

7.(a) Prepare a presentation with 5to 6 slides on 'Technology and Excessive Use'

(b) Write the articles in the blanks:

- (i) I met him----- year ago.
