

III B. Tech I Semester Supplementary Examinations, May-2019 DESIGN AND DRAWING OF REINFORCED CONCRETE STRUCTURES

Time: 3 hours

(Civil Engineering)

Max. Marks: 70

Answer any ONE Question from Part – A and any THREE Questions from Part – B Use of IS: 456-2000 and design charts for Columns interaction diagrams only from SP-16 is allowed.

PART –A

- 1 Deign a reinforced concrete beam of size 300x450mm simply supported over effective [28M] span of 4.5m carrying moment 40kN-m and shear 25kN. The beam is supported by 300mm thick walls. Use M25 grade concrete and Fe415 steel; design the beam section for shear, bending and serviceability conditions include curtailment of reinforcement and anchorage requirements. Neatly sketch the detailing of reinforcement.
- 2 Design a R.C circular column and circular footing of column subjected to axial load [28M] 300kN and moment 12kN-m. Assume safe bearing capacity of soil at a depth 1.5m below ground is 250kN/m². Assume size of column size restricted to 300 mm diameter, and its effective length 4m. Check the design for both column and footing for shear, bending and anchorage requirements.

Neatly sketch the reinforcement details for column and footing. Use M25grade concrete and HYSD steel Fe415.

PART -B

Find the steel reinforcement required to resist bending moment 28kN-m and shear 16kN [14M] of rectangular simply supported R.C beam 250x400mm. Give the curtailment of reinforcement, shear and anchorage requirements of bars. Use M25 grade concrete and Fe415 steel HYSD. (Use working stress method). Assume the following data.

Steel young's modulus $Es=2.0 \times 10^5 MPa$, modular ratio m=8, clear cover=40mm

- 2 A rectangular R.C beam of size 300x450mm is reinforced with tensile steel 3no 16mm [14M] diameter bars and compressive steel 3nos 12mm diameter bars. Find out the allowable bending stress in concrete and steel if the beam subjected to maximum bending moment of 60kN-m .Use effective cover to reinforcement 50mm .Suggest the grade of concrete and steel used for beam design.
- A rectangular cantilever beam 250x300mm projected over a span of 2.4m subjected to [14M] imposed load 6kN/m. Design the beam for bending , shear reinforcement and anchorage requirements. Use M20 grade concrete and Fe415 steel. Neatly sketch the reinforcement detailing.
- 4 Design a R.C slab of effective size 3mx8m simply supported on four edges and carrying [14M] live load 6kN/m². Assume the corners are restrained at ends. Design the slab for shear, bending and torsion (use I.S code method). Use M20 grade concrete Fe415 steel.
- 5 Design a R.C rectangular footing for column carrying axial load 60kN. Assume the size [14M] of column 300x300mm and allowable bearing pressure of soil 240kN/m² at a depth 1.20m below ground. Design the footing for shear, bending and anchorage. Use M20 grade concrete Fe415 steel.
